(54) Title: LOCATING SYSTEM, DEVICE AND METHOD

(57) Abstract: A locating system is disclosed, which can be used for locating a child. The system comprises a child locating device (parent unit) and a further device (child unit) carried or worn by the child. The child unit transmits an electromagnetic signal towards the parent unit, and the parent unit receives the electromagnetic signal, using at least three spaced antennas which are switched in such a way as to obtain a Dopplercant effect. The received signal is processed and the direction of the child unit with respect to the parent unit is displayed on a display on the parent unit. Distance measurement is also possible. The system can be used with several child units.
